

FIRST-WATCH

NOTIFICATION SYSTEM

The Jensen Mixers 600 Series First-Watch Notification system design alerts the customer to changes in operation of the mixer.

The First-Watch system is field installable for older units and monitors vibration and seal health and accommodates customer system tailoring to their own operating requirements.

Vibration Monitoring: Is performed by the Murphy Mechanical Vibration switch. Customers may set vibration levels

accommodating their location's unique operating parameters or procedures.

An electronic system with feedback and remote reset is also available.

Seal Health System Integrity Monitoring: Starts with a Thomas Products visual "Green Light Red Light" float switch. This

provides a visual first alert monitoring system for seal integrity confirmation via distance viewing without close examination.

A center 1" sight glass allows for easy visual inspection.

Customers requiring more rapid response may install a float switch or non-contact sensor for electronic monitoring.

Demonstrative photo only, actual design may vary.

Combined, the Jensen Mixers 600 Series Alert Notification system is a simple and robust way to monitor Mixer vibration and seal integrity in today's ever changing environments. Contact Jensen for more information.
